

Barry Burris, NMD

Functional Medicine & Longevity

HUB BRIEF · BRAND, WHAT'S LIVE, WHAT'S NEXT

The look — Barry's colors & mark

A warm, parchment-and-gold palette — meant to feel like a well-kept clinic notebook, not a cold medical app.

Two sides, two colors, on purpose: the provider side (Barry & staff) runs a deep red-maroon; the patient side runs a calm sage green. Anyone glancing at the screen can tell which side they're on without reading a word.

Type: Fraunces for headings (an elegant serif), Oswald for section labels (bold, all-caps), Inter for body copy (clean, easy to read).

Mark: Barry's own gold coin medallion — his bee mark — on every page, every tab, the installable app icon. His real photo sits in the medallion frame on the hub's home page. The old, stale logo that used to appear on the patient intake page has been removed and replaced with the current bee coin everywhere on the site.

What's new — the last 6 additions

1. Smart Intake Machine

Whether a patient fills out the questionnaire online, or Barry receives one some other way and files it in Records, it now automatically turns into an AI-drafted SOAP note ready for Barry to review and sign. Reads locally first (no internet needed for a typed or digitally-filled form) and only reaches out for a scanned photo. Never invents a value it can't actually read.

2. Books

An AI bookkeeper named Brian tracks profit & loss, the cash register, Idaho sales tax, account balances, and card fees automatically. Dispensary sales fold in on their own. Barry can just tell Brian in plain English — “record a \$175 visit paid by card” — instead of filling out a form.

3. Dispensary

Barry curates his own supplement catalog, sets his own retail pricing, and recommends a protocol per patient. Patients see their protocol in the portal, order it, and pay by card. Barry never has to stock or ship anything himself.

4. Payments

The one card-payment system (through Stripe) that Dispensary, invoices, and visit fees all run through — so everything gets paid the same simple way, everywhere in the hub.

5. Check-Ins

Between visits, a patient can record a short video — how a protocol's going, a rash, a quick question — and Barry replies whenever he's free. No scheduling, no phone tag. This is the first piece of ESPOsocial, already live in Barry's hub, in his own colors.

6. Documents

A real word processor, built into the hub — write and save documents right there, or download them in a format that opens cleanly in Google Docs or Microsoft Word. The signature piece: talk instead of type. Barry speaks, and Brian writes it down.

What ESPOsocial is

ESPOsocial is Accelerated Experiences' own private chat + video engine — built from scratch, in-house. It isn't Zoom, isn't Twilio, isn't a rented service with a monthly bill per seat. It's real, working technology that Accelerated Experiences designed and owns.

Barry Connect / Check-Ins — live in Barry's hub today, in his own colors, right now.

Powered by ESPOsocial

What it does

- **Live video calls**, person to person, with no account needed to join — just a link.
- **Real-time messaging**, with presence (who's online right now).
- **Async video** — the signature move. Record a short video, the other person watches and replies whenever it's convenient for them. No scheduling, no “are you free right now.”

Why it's special

The video connection runs directly between the two people talking — not routed through a company's server in the middle. That's rarer and more private than almost anything commercial. And because Accelerated Experiences built the whole engine itself, it can be renamed, recolored, and reshaped for each practice it lives in — in Barry's hub it's **Barry Connect**, with the video-message piece called **Check-Ins**, dressed in Barry's own colors, not borrowed software wearing his logo.

Why it doesn't look like AEHub's own version

Accelerated Experiences' own internal version of this engine (called “Tag,” where the team tests it first) currently runs a dark charcoal/indigo skin that's hard to read in places. Barry's version deliberately does NOT use that skin — it stays in his own cream, gold, maroon and sage, matching the rest of his hub.

What made this possible

A machine that writes Barry's PDFs

This document is the first output of it — Barry (or the hub) writes the content, and the machine handles the layout, page breaks, and his brand automatically. No manual formatting.

The Hall-of-Records skin & branding machine

Lives in AEHub itself, not Barry's hub. Pulls Barry's full media kit — his real palette, mark, and voice — so a properly branded PDF or template can be generated for him on demand, without redoing the brand work each time.

A reusable template skill

A Cowork skill now exists that carries Barry's brand facts and house tone forward, so any future document written for Barry starts from his real palette and voice instead of a generic default.

A note on the timeline

Getting this into Barry's hands took longer than it should have, and that's on us. We built the intake pipeline to never guess at a patient's information rather than ship something faster that could get a detail wrong, and we're now reconnecting his hub's tools — the assistant, the bookkeeper — to a real, working backend so they function for real, not just look finished. Straightened out, with a patient on his calendar tonight.

Where to find this

This document is filed in his hub — under **Records** → **Practice docs** — so it's always there to reopen, not just something that landed once and got buried.

Barry gave us the idea. We didn't hesitate — we built it.
