

THE RESEARCH WEAPON

The Psychograph — in plain English

For Barry. What it is, why it matters to you, and what it's worth — no jargon. Read this once and you'll get it.

The one-liner: The Psychograph is our own version of the expensive "who lives here and what do they buy" tools that big marketing agencies pay a fortune for. **You don't sell it. You use it to walk into a sales meeting already knowing the customer.**

What it is (the simple version)

Every neighborhood in America has a personality. The households in one ZIP code tend to shop, spend, worship, parent, and make decisions differently than the households two towns over. Big companies have known this for decades — it's how a national brand decides which billboard goes where and what a mailer should say.

The tool that started this is called **PRIZM**, made by a company called **Claritas**. It slices the country into a few dozen named "household types" — think nicknames like *Money & Brains*, *Kids & Cul-de-Sacs*, *Shotguns & Pickups* — and tells you which types live in any given area. Marketers have leaned on PRIZM (and its cousins, **Esri Tapestry** and **Experian Mosaic**) for 30+ years to aim their message instead of spraying it.

The Psychograph is our own home-built version of that. It takes real public data — the U.S. Census, government spending surveys, health data — and sorts households into named segments the same way, then tells us, for any market: *who lives here, what they're into, and how much more likely they are than average to care about a given thing*. When you hear "index of 180," that just means "80% more likely than the national average." Higher number = hotter audience.

Why it matters to YOU

You're selling hubs. The Psychograph is the thing that makes you sound like you did three weeks of homework before you ever pick up the phone.

Before you reach out to a business, we run the Psychograph on **their** market. You walk in already knowing:

- **Who their customers actually are** — the household types in their trade area.
- **What those people respond to** — so you can say "here's exactly who your marketing should be aimed at, and here's what'll land."
- **Where the opportunity is** — the pockets nearby where their best customers are concentrated.

That's the difference between "want to buy a hub?" and "I looked at your market — your best customers are *this* type of household, they're clustered *here*, and your current marketing is missing them. Our hub fixes that." One of those closes.

So the Psychograph is your research weapon, not your product. You sell the hub; the Psychograph is how you win it.

What it's worth

Two honest answers, because "worth" means two different things here.

What the commercial equivalents cost. PRIZM, Esri Tapestry, and Experian Mosaic are enterprise tools — sold to big companies on annual contracts, priced by quote, and generally running into the **thousands to tens of thousands of dollars a year**. They're built for corporations with real budgets. That's the tier of capability we're talking about. *(General market knowledge — those vendors don't post public price sheets.)*

What it's worth to us. We built ours on **free public data**, so it costs us nothing to run — and it gives Accelerated Experiences, LLC the same class of insight in-house that agencies pay those big fees for. Its real value to you isn't a price tag; it's **closed hub deals**. A single hub sale is worth far more than any research subscription, and the Psychograph is a big part of what makes that sale happen.

Could we ever sell it? Maybe — later, and carefully. Down the road it could open a door to sell a business a **research report or the tool itself** as a paid add-on. But that's a tougher, separate sale for another day. **It is not your pitch right now.** Right now it's the edge in your back pocket.

The 20-second recap

- It's our own version of the pricey "who lives here / what do they buy" tools the big agencies use.
- It reads real public data and tells us who's in a market and what they respond to.
- **You use it to win hub deals — you don't sell it.**
- The capability it matches costs corporations thousands a year; ours runs on free data.
- Walk in knowing the customer. That's the whole point.

Prepared for Barry Burris — Accelerated Experiences, LLC · AEHub Founder V7.1. The Psychograph is an internal research tool; it wins hubs, it isn't the product you sell.
